

## CHAPTER 10: FILE-SYSTEM INTERFACE

- File Concept
- Access Methods
- Directory Structure
- Protection
- Consistency Semantics

# File Concept

- Contiguous logical address space
- Types:
  - Data
    - numeric
    - character
    - binary
  - Program
    - source
    - object (load image)
  - Documents

## File Structure

- None - sequence of words, bytes
- Simple record structure
  - Lines
  - Fixed length
  - Variable length
- Complex Structures
  - Formatted document
  - Relocatable load file

Can simulate last two with first method by inserting appropriate control characters.

Who decides:

Operating system

Program

- File Attributes
  - **Name** – only information kept in human-readable form.
  - **Type** – needed for systems that support different types.
  - **Location** – pointer to file location on device.
  - **Size** – current file size.
  - **Protection** – controls who can do reading, writing, executing.
  - **Time, date, and user identification** – data for protection, security, and usage monitoring.
- Information about files are kept in the directory structure, which is maintained on the disk.

## File Operations

- create
- write
- read
- reposition within file – file seek
- delete
- truncate
- $\text{open}(F_i)$  – search the directory structure on disk for entry  $F_i$ , and move the content of entry to memory.
- $\text{close}(F_i)$  – move the content of entry  $F_i$  in memory to directory structure on disk.

## File Types – name.extension

File type	Usual extension	Function
Executable	exe, com, bin or none	ready-to-run machine- language program
Object	obj, o	compiled, machine lan- guage, not linked
Source code	c, p, pas, f77, asm, a	source code in various lan- guages
Batch	bat, sh	commands to the com- mand interpreter
Text	txt, doc	textual data, documents
Word processor	wp, tex, rrf, etc	various word-processor formats
Library	lib, a	libraries of routines for programmers
Print or view	ps, dvi, gif	ASCII or binary file in a format for printing or viewing
Archive	arc, zip, tar	related files grouped into one file, sometimes com- pressed, for archiving or storage

## Access Methods

- Sequential Access

*read next*

*write next*

*reset*

*no read after last write*

*(rewrite)*

- Direct Access

*read n*

*write n*

*position to n*

*read next*

*write next*

*rewrite n*

*n* = relative block number

Directory Structure – a collection of nodes containing information about all files.

Directory

- Both the directory structure and the files reside on disk.
- Backups of these two structures are kept on tapes.

## Information in a device directory:

- Name
- Type
- Address
- Current length
- Maximum length
- Date last accessed (for archival)
- Date last updated (for dump)
- Owner ID (who pays)
- Protection information (discuss later)

## Operations performed on directory:

- Search for a file
- Create a file
- Delete a file
- List a directory
- Rename a file
- Traverse the file system

Organize the directory (logically) to obtain:

- Efficiency – locating a file quickly.
- Naming – convenient to users.
  - Two users can have same name for different files.
  - The same file can have several different names.
- Grouping – logical grouping of files by properties, e.g., all Pascal programs, all games, ...

Single-Level Directory – a single directory for all users.

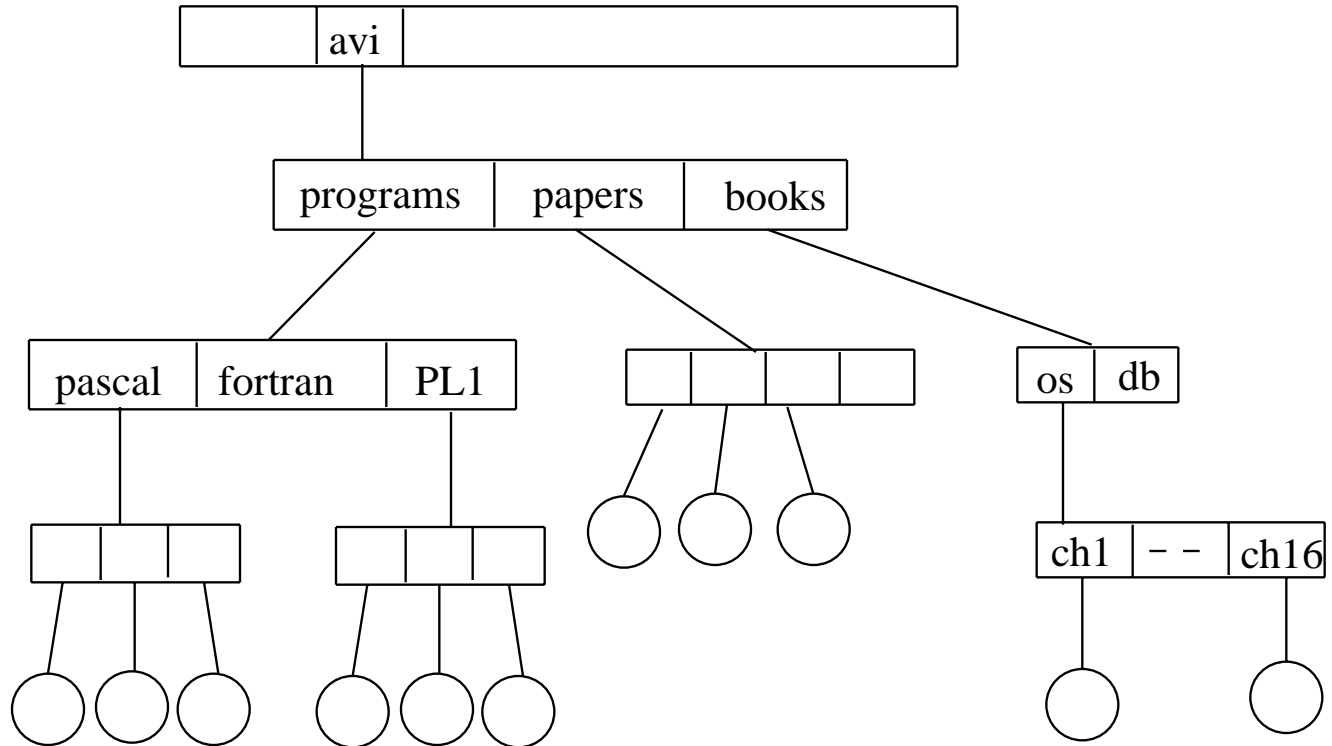

- Naming problem
- Grouping problem

Two-Level Directory – separate directory for each user.

- Path name
- Can have the same file name for different user
- Efficient searching
- No grouping capability

# Tree-Structured Directories

- Efficient searching
- Grouping capability
- Current directory (working directory)

**cd** /avi/books/os

**type** ch1

- Absolute or relative path name
- Creating a new file is done in current directory.
- Delete a file

**rm** <file-name>

- Creating a new subdirectory is done in current directory.

**mkdir** <dir-name>

Example: if in current directory /avi/books

**mkdir** modula

- Deleting “books”  $\Rightarrow$  deleting the entire subtree rooted by “books”.

Acyclic-Graph Directories – have shared subdirectories and files.

- Two different names (aliasing)
- If A deletes D  $\Rightarrow$  dangling pointer.

Solutions:

- Backpointers, so we can delete all pointers.  
Variable size records a problem.
- Backpointers using a daisy chain organization.
- Entry-hold-count solution.

## General Graph Directory

- How do we guarantee no cycles?
  - Allow only links to file not subdirectories.
  - Garbage collection.
  - Every time a new link is added use a cycle detection algorithm to determine whether it is OK.

# Protection

- File owner/creator should be able to control:
  - what can be done
  - by whom
- Types of access
  - Read
  - Write
  - Execute
  - Append
  - Delete
  - List

## Access Lists and Groups

- Mode of access: read, write, execute
- Three classes of users

			RWX
a) owner access	7	$\Rightarrow$	1 1 1
			RWX
b) group access	6	$\Rightarrow$	1 1 0
			RWX
c) public access	1	$\Rightarrow$	0 0 1

- Ask manager to create a group (unique name), say  $G$ , and add some users to the group.
- For a particular file (say *game*) or subdirectory, define an appropriate access.

- Attach a group to a file

**chgrp**  $G$  *game*
