# **Module 10: File-System Interface**

- File Concept
- Access :Methods
- Directory Structure
- Protection
- Consistency Semantics

## **File Concept**

- Contiguous logical address space
- Types:
  - Data
    - \* numeric
    - \* character
    - \* binary
  - Program

#### File Structure

- None sequence of words, bytes
- Simple record structure
  - Lines
  - Fixed length
  - Variable length
- Complex Structures
  - Formatted document
  - Relocatable load file
- Can simulate last two with first method by inserting appropriate control characters.
- Who decides:
  - Operating system
  - Program

#### **File Attributes**

- Name only information kept in human-readable form.
- Type needed for systems that support different types.
- Location pointer to file location on device.
- Size current file size.
- Protection controls who can do reading, writing, executing.
- Time, date, and user identification data for protection, security, and usage monitoring.
- Information about files are kept in the directory structure, which is maintained on the disk.

## **File Operations**

- create
- write
- read
- reposition within file file seek
- delete
- truncate
- open(F<sub>i</sub>) search the directory structure on disk for entry F<sub>i</sub>, and move the content of entry to memory.
- close  $(F_i)$  move the content of entry  $F_i$  in memory to directory structure on disk.

# File Types – name, extension

File Type	Usualextension	Function	
Executable	exe, com, bin or	ready-to-run machine-	
	none	language program	
Object	obj, o	complied, machine	
		language, not linked	
Source code	c, p, pas, 177,	source code in various	
	asm, a	languages	
Batch	bat, sh	commands to the	
		command interpreter	
Text	txt, doc	textual data documents	
Word processor	wp, tex, rrf, etc.	various word-processor	
_		formats	
Library	lib, a	libraries of routines	
Print or view	ps, dvi, gif	ASCII or binary file	
Archive	arc, zip, tar	related files grouped	
		into one file, sometimes	
		compressed.	

#### **Access Methods**

Sequential Access

read next
write next
reset
no read after last write
(rewrite)

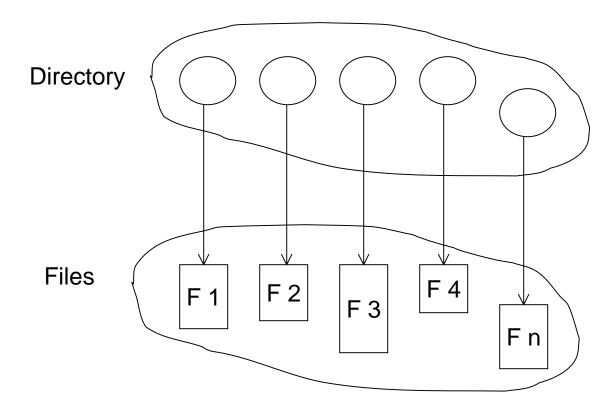

Direct Access

read n
write n
position to n
read next
write next
rewrite n

n = relative block number

### **Directory Structure**

A collection of nodes containing information about all files.

- Both the directory structure and the files reside on disk.
- Backups of these two structures are kept on tapes.

## **Information in a Device Directory**

- Name
- Type
- Address
- Current length
- Maximum length
- Date last accessed (for archival)
- Date last updated (for dump)
- Owner ID (who pays)
- Protection information (discuss later)

## **Operations Performed on Directory**

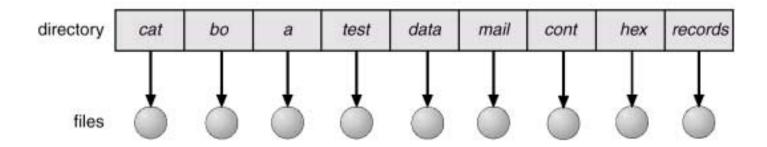

- Search for a file
- Create a file
- Delete a file
- List a directory
- Rename a file
- Traverse the file system

# Organize the Directory (Logically) to Obtain

- Efficiency locating a file quickly.
- Naming convenient to users.
  - Two users can have same name for different files.
  - The same file can have several different names.
- Grouping logical grouping of files by properties, (e.g., all Pascal programs, all games, ...)

# **Single-Level Directory**

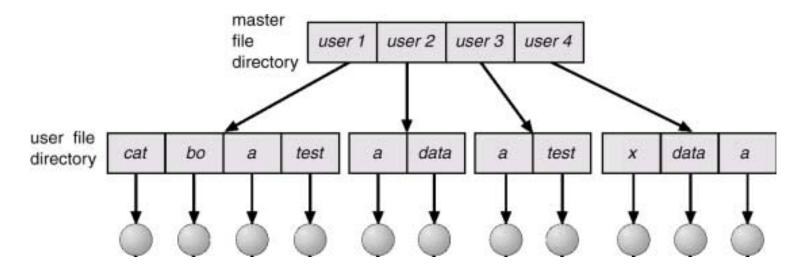

A single directory for all users.

- Naming problem
- Grouping problem

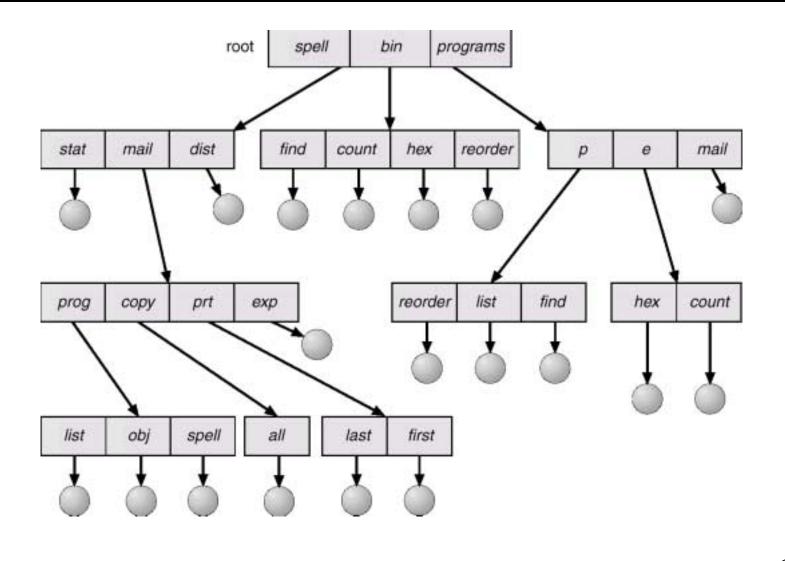

## **Two-Level Directory**

Separate directory for each user.

- Path name
- Can have the saem file name for different user
- Efficient searching
- No grouping capability

#### **Tree-Structured Directories**

## **Tree-Structured Directories (Cont.)**

- Efficient searching
- Grouping Capability
- Current directory (working directory)
  - cd /spell/mail/prog
  - type list

## **Tree-Structured Directories (Cont.)**

- Absolute or relative path name
- Creating a new file is done in current directory.
- Delete a file

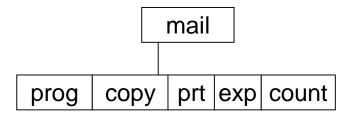

rm <file-name>

Creating a new subdirectory is done in current directory.

mkdir <dir-name>

Example: if in current directory /spell/mail

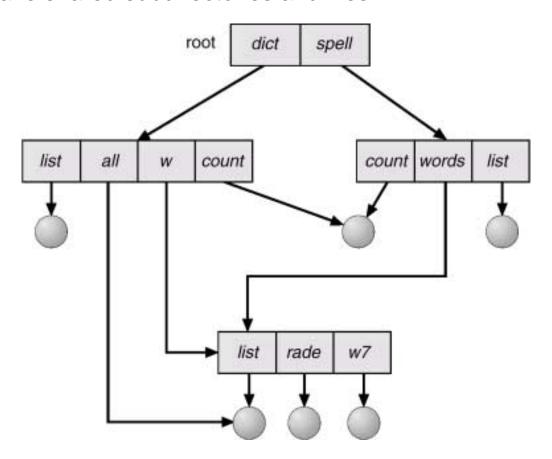

mkdir count

Deleting "mail" ⇒ deleting the entire subtree rooted by "mail".

# **Acyclic-Graph Directories**

Have shared subdirectories and files.

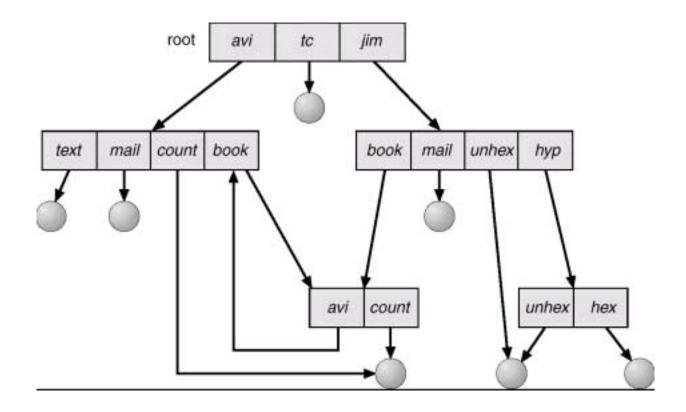

## **Acyclic-Graph Directories (Cont.)**

- Two different names (aliasing)
- If dict deletes list ⇒ dangling pointer.

#### Solutions:

- Backpointers, so we can delete all pointers.
   Variable size records a problem.
- Backpointers using a daisy chain organization.
- Entry-hold-count solution.

# **General Graph Directory**

# **General Graph Directory (Cont.)**

- How do we guarantee no cycles?
  - Allow only links to file not subdirectories.
  - Garbage collection.
  - Every time a new link is added use a cycle detection algorithm to determine whether it is OK.

#### **Protection**

- File owner/creator should be able to control:
  - what can be done
  - by whom
- Types of access
  - Read
  - Write
  - Execute
  - Append
  - Delete
  - List

## **Access Lists and Groups**

- Mode of access: read, write, execute
- Three classes of users

			LVV
a) owner access	7	$\Rightarrow$	111
·			RWX
b) groups access	6	$\Rightarrow$	110
			RWX
c) public access	1	$\Rightarrow$	0 0 1

- Ask manager to create a group (unique name), say G, and add some users to the group.
- For a particular file (say *game*) or subdirectory, define an appropriate access. owner group public

chmod 761 game

Attach a group to a file

chgrp G game

**DWY**
